Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

\$888888\$	The present invention relates to GB virus-B. The nucleic acid molecules of the invention are useful for indirectly studying the molecular properties of hepatitis C virus (HCV). The infectious nucleic acid sequence of the GB virus-B clone and the HCV/GBV-B chimeras may be used in the development of vaccines and therapeutics for HCV. This invention relates to a novel GB virus-B (GBV-B) replicon and replicon enhanced cells. A GBV-B replicon is an RNA molecule able to autonomously replicate in a cultured cell to produce detectable levels of autonomously replicate in a cultured cell to produce detectable levels of one or more GBV-B proteins. Specifically, it may comprise the GBV-B 5' (UTR, GBV-B structural region, selection or reporter sequence, internal ribosome entry site, NS3-NS5B sequence, and GBV-B 1'WIR. Accordingly, they are useful in providing tools for studying GBV-B replication, they are useful in providing a sortsoafe model for identifying compounds that inhibit GBV-B, providing a surrogate model for identifying compounds that inhibit cc GBV-B, providing a scaffold for producing GBV-B/HCV chimeric replicons. One to the similarity between GBV-B and the hepatitis C virus (HCV), compounds that inhibit GBV-B may be useful antiviral agents, specifically anti-HCV agents. The GBV-B may be useful antiviral agents, specifically compounds the regions coding for structural proteins and the NS2 protein with the sequences of enemycan phosphotransferase gene (neo) and encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) in the plasmid FU3/pAcxC177. This polypeptide sequence is the GBV-B replicon control of the plasmid FU3/pAcxC177. This polypeptide sequence is the deguence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 GLQTLAQAALPAHGWGRQDPRHKSRNLGILLDYPLGWIGDVTTHTPLVGPLVAGAVVRPV 120

Clones were rescued from the lambda phage, searched against a sequence database and found to be unique HGBV sequences. The clones were then used to assemble the sequences AAT00129/30 (GB contig A and B) which encode the proteins AAR94345-47 (the 3 possible coding strand reading frames) and AAR82072, respectively. Reagents which comprise the HGBV DNA, or its protein prods. can be used for the diagnosis, therapy or in a vaccine to prevent HGBV infection. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Non-A, non-B, non-C, non-D, non-E Hepatitis virus reagents - useful for diagnosis and therapy of hepatitis GB virus.

```
The present invention describe a method for detecting target hepatitis GB virus (HGBV) nucleic acid (THN) in a test sample (T) suspected of containing HGBV. The method involves reacting (T) with a HGBV polynucleotide probe (I) containing 15 contiguous nucleotides, and which selectively hybridises to the HGBV genome or its full complement, and detecting the complex that contains THN, indicating the presence of target HGBV. The method is used for detecting target HGBV nucleic acid in the test sample suspected of containing HGBV and for characterisation of newly ascertained etiological agent of non-A, non-B, non-C, non-D and non-B E hepatitis causing agents collectively termed as hepatitis GB virus. AAA55270 to AAA55489 and AAB08985 to AAB09480 represent nucleotide and protein sequences used in the exemplification of the present invention. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                              Detecting target hepatitis GB virus nucleic acid in a test sample suspected of containing HGBV comprises reacting the test sample the polynucleotide probe and detecting the complex that contains target
                                                                                                                                                                                    Pilot-Matias TJ, Buijk S

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describe a method for detecting target hepatitis GB virus (HGBV) nucleic acid (THN) in a test sample (T) suspected of containing HGBV. The method involves reacting (T) with a HGBV polynucleotide probe (I) containing 15 contiguous nucleotides, and which selectively hybridises to the HGBV genome or its full complement, and detecting the complex that contains THN, indicating the presence of target HGBV. The method is used for detecting the presence of newly ascertained euspected of containing HGBV and for characterisation of newly ascertained etiological agent of non-A, non-B, non-C, non-D and non-B hepatitis causing agents collectively termed as hepatitis GB virus. AAAA5570 to AAA55489 and AAB08985 to AAB09480 represent nucleotide and protein sequences used in the exemplification of the present invention. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                            Hepatitis GB virus; HGBV; diagnosis; therapeutic; immunogenic; infection; detection; characterisation; hepatitis.

                                                                                                                                                          7
                                                                                                                                                                               1064
                                                                                                                                                                                                                     1124
                                                                                                                                                                                                                                                           1184
                                    tamarin plasma, using standard procedures, was used to prepare a lambda phage HGBV cDNA library. The cDNA clone AAT00052, which encodes the proteins AAR82066-71 (the 6 possible reading frames), was rescued from the lambda phage, searched against a sequence database and found to be an unique HGBV sequence. Reagents which comprise the HGBV DNA, or its protein prods. can be used for the diagnosis, therapy or in a vaccine to prevent HGBV infection. (Updated on 27-AUG-2003 to correct OS field.)

                                   The present invention relates to GB virus-B. The nucleic acid molec of the invention are useful for indirectly studying the molecular properties of hepatitis C virus (HCV). The infectious nucleic acid sequence of the GB virus-B clone and the HCV/GBV-B chimeras may be in the development of vaccines and therapeutics for HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ::

WPI; 2001-071081 N-PSDB; AAC86937

New nucleic acid comprising a chimeric bovine viral diarrhea virus gin which the (non-)structural region has been replaced by hepatitis virus (HCV) genome useful for treating or preventing HCV signs and вущртотв

Disclosure; Page 85-97; 97pp; English.

The specification describes a nucleic acid comprising a chimeric virus genome, specifically bovine viral diarrhoea virus (BVDV) genome in which the (non-) structural region has been replaced by the (non-) structural region of a hepatitis C virus (HCV) genome. The nucleic acids comprising the chimeric virus and the chimeric virus are useful for identifying cell inse acapable of supporting the replication of these chimeric viruses, in screening for neutralizing antibodies to HCV of different genotypes, in the production of HCV-BVDV virions, for the development of inactivated or attenuated vaccines to prevent HCV-BVDV in a mammal, in studying the molecular properties of HCV indirectly in vitro, and in identifying inhibitors of viral enzyme activity which would be useful as antiviral agents. Formulations or compositions comprising the chimeric virions may be usefuce is encoded by a HCV clone, which is used to construct chimeric nucleic acids of the invention

The present sequence represents an amino acid sequence of infectious Hepatitis C virus (HCV) strain HC-J6CH genotype 2a. The HCV polynucleotide sequence is capable of expressing the virus when transfected into cells. The HCV protein is useful for assaying candidate antiviral agents for activity against HCV. Antibodies specific for HCV polypeptide are useful in prevention and treatment of diseases caused by HCV in animals, in particular humans. The HCV polypeptides serve as immunogens in the development of vaccines for preventing HCV in mammals or as antigens in diagnostic assays for detecting the presence of HCV in biological samples. The HCV polynucleotide is also useful for identifying cell lines capable of supporting the replication of HCV in vitro and to produce attenuated viral strains via passage in vitro or in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid molecule encoding human hepatitis C virus of genotype 2a for developing vaccines, for diagnosis of hepatitis C virus and in screening assays for identification of antiviral agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     144 VVCLLS-LACPCSGARVTDPDTNTTLTNCCQRNQVIYCSPSTCLHEPGCVIC----AD 197

RNA was isolated from the plasma of human patients positive for NANBH virus (strain HC-J8) and was subjected to reverse transcription to produce cDNA. The resulting cDNA was amplified by PCR, and nucleic acid sequences determined by analysis of clones obtd. by PCR amplification (42 clones in total). The NANBH HC-J8 genome was found to contain a degenerate open reading frame encoding polypeptide precursors of 3033 amino acid residues. See also ARR33538 and ARR33214. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 27-AUG-2003 to correct OS field.)

The invention relates to a human polypeptide related to hepatitis C virus (HVV), and the polymucleotide encoding it. The polypeptide can be used for the development of gene therapy on fulminant hepatitis C. This sequence represents a human HCV-related polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    298 HWFVQ-----ECNCSIYPGTITGHRMAWDMMNWSPTATMILAYVMRVPEVIIDIVSG 350

The invention relates to nucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region coding for one or more NS3, NS54, or EMCV IRES mutations, respectively. The location of the mutations are detailed in the specification. Also included are (1) an expression of comprising an utleotide sequence coding for the altered nucleic caids, which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell human hepatoma cell comprising the altered nucleic acids (4) producing an HCV (hepatitis C virus) replicon enhanced cells made in the method; and (6) measuring the ability of a compound to affect HCV activity. The HCV replicons and HCV replicon enhanced cells made in the method; and (6) measuring the ability of a compound to affect HCV activity. The HCV replicons and HCV replicon enhanced cells are useful in studying HCV replication and proteins, and HCV and host cell interactions, producing HCV RNA and proteins, and providing a system for measuring the ability of a compound to more HCV activities e.g. to discover drugs which may treat HCV mediated diseases such as liver failure, cirrhosis and

Internal ribosome entry site (IRES) region coding for one or more NS3, NS3 or HCV NS5 encoding region, or encephalomyccarditis virus (EMCV) internal ribosome entry site (IRES) region coding for one or more NS3, NS3, or EMCV IRES mutations. Respectively. The location of the mutations are detailed in the specification. Also included are (1) an expression vector comprising a mucleofide sequence coding for the altered nucleic acids, which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell human hepatoma cell comprising the altered nucleic acids; (3) a recombinant cell produced by introducing into a human hepatoma cell the altered nucleic acids; (4) producing an HCV (hepatitis C virus) cell the altered nucleic acids; (5) an HCV replicon enhanced cells made in the method; and (6) measuring the ability of a compound to affect HCV activity. The HCV replicons and HCV and host cell interactions, producing HCV RNA and expression, and HCV and host cell interactions, producing HCV RNA and providing a system for measuring the ability of a compound compliate one one or more HCV activities e.g. to discover drugs which may treat HCV mediated diseases such as liver failure, cirrhosis and chapted diseases such as liver failure, cirrhosis and chapted diseases such as liver failure, cirrhosis and chapter carcinoma. The present sequence is the HCV replicon CO I polyprotein (comprising the Core, E1, E2, P7, NS2, NS3, NS4A, NS4B, NS5A

The Invention relates to nuclear acts uniscented to compare to the invention relates to nuclear acts uniscentifies trues (EMCV)

Internal ribosome entry site (IRES) region coding for one or more NS3, and the mutations are detailed in the specification. Also included are (1) an expression of the mutations are detailed in the specification. Also included are (1) an expression coefficient of the mutations are detailed in the specification. Also included are (1) an expression of comprising a nucleotide sequence coding for the altered nucleic acids, which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell broadwead ell comprising the altered nucleic acids; (3) a recombinant cell produced by introducing into a human hepatoma cell the altered nucleic acids; (4) producing an HCV (hepatitis C virus) an HCV replicon enhanced cells are useful in studying and (6) measuring the ability of a compound to affect HCV activity. The HCV replication and capteression, and HCV and host cell interactions, producing HCV RNA and providing a system for measuring the ability of a compound confulate one or more HCV activities e.g. to discover drugs which may treat HCV mediated diseases such as liver failure, cirrhosis and chaptered in the present sequence is the HCV replicon Con 1 contractions (contraction comprising the Core, El, E2, P7, NS2, NS3, NS4A, NS4B, NS5A

The invention relates to nucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region coding for one or more NS3, NS54, or EMCV IRES mutations, respectively. The location of the mutations are detailed in the specification. Also included are (1) an expression of comprising an uteleotide sequence coding for the altered nucleic acids, which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell human hepatoma cell comprising the altered nucleic acids (1) as recombinant cell produced by introducing into a human hepatoma cell the altered acids; (4) producing an HCV (hepatitis C virus) replicon enhanced cells made in the method; and (6) measuring the ability of a compound to affect HCV activity. The HCV replicons and HCV replicon enhanced cells are useful in studying HCV replication and protein and host cell interactions, producing HCV RNA and proteins, and HCV and host cell interactions, producing HCV RNA and proteins, and providing a system for measuring the ability of a compound compound to more HCV activities e.g. to discover drugs which may treat HCV mediated diseases such as liver failure, cirrhosis and

```

genome polyprotein - hepatitis C virus (strain H) N.Contains: capsid protein C, envelope protein M; hepacivirin (EC 3.4.21.98) (nonstructur protein NS4a; nonstructural protein NS4b; nonstructural protein NS5

process the partitis C virus
A,Note: host Homo sapiens (man)
C,Species: hepatitis C virus
A,Note: host Homo sapiens (man)
C,Bate: 31-bec-1992 #sequence_revision 31-bec-1992 #text_change 09-Jul-2004
C,Accession: A36814; A41546
R;Inchauspe, G.; Zebedee, S.; Lee, D.H.; Sugitani, M.; Nasoff, M.; Prince, A.M.
Submitted to Genbank, July 1992
A,Description: Genomic structure of the human prototype strain H of hepatitis C virus: CC
A,Reference number: A36814
A,Rolecule type: genomic RNA
A,Residues: 1-3011 <INC>
A,Cross-references: UNIPROT:P27958; GB:M67463; NID:g329737; PIDN:AAA45534.1; PID:g329738
R;Inchauspe, G.; Zebedee, S.; Lee, D.H.; Sugitani, M.; Nasoff, M.; Prince, A.M.
A,Residues: G. Stoledee, S.; Lee, D.H.; Sugitani, M.; Nasoff, M.; Prince, A.M.
A,Title: Genomic structure of the human prototype strain H of hepatitis C virus: comparit

A;Contents: annotation A;Note: neither amino acid nor nucleotide sequence is given C;Superfamily: hepatitis C virus genome polyprotein C;Keywords: ATP; capsid protein; envelope protein; glycoprotein; hydrolase; nonstructura) F;1-115/Product: capsid protein C #steatus predicted <CPC> F;116-191/Product: envelope protein M #status predicted <EPM>

Arrage/RNA helicase - hepatitis C virus (fragment)
C;Species: hepatitis C virus
C;Species: hepatitis C virus
C;Species: hepatitis C virus
C;Accession: S68016
R;Jin, L.; Peterson, D.L.
Arch. Biochem. Biophys. 323, 47-53, 1995
A;Title: Expression; isolation, and characterization of the hepatitis C virus ATPase/RNA A;Reference number: S68016; MUID:96019946; PMID:7487072
A;Reference number: S68016 MUID:96019946; PMID:7487072
A;Reference number: S68016
A;Status: preliminary
A;Molecule type: mRNA
A;Status: preliminary
A;Molecule type: mRNA
A;Status: UNIPROT:Q04045
C;Superfamily: hepatitis C virus genome polyprotein
C;Reywords: ATP; nonetructural protein; nucleotide binding motif A (P-loop)
F;86-91/Region: nucleotide-binding motif B
F;90-93/Region: DEXH motif

Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

- permanent accession numbers. The new UniProt record may not contain the previous temporary numbers from the most recent version of UniProt. These sequences have been assigned new Please note that the curators of the UniProt database have purged some temporary accession accession number.
- extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein If you encounter an accession number from an older search run against UniProt (results file Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

members of the public who may encounter UniProt temporary accession When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or numbers.
